

**Amendments to the Claims:**

Claims 1-10 and 12-32 are currently pending with claims 1, 10, 22, and 25 having been amended. This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (Currently Amended) A method for obtaining a postage stamp by a user system, comprising a processor, a memory, and a printer, from a website server over a communications network, said method comprising:
  - requesting said stamp from said website server over the Internet;
  - receiving ~~an~~ a markup language message over the Internet comprising encoded binary data representing a machine-readable portion of an indicium associated with said stamp, said indicium comprising a digital signature;
  - verifying that a user is an authorized user and that a serial number of a medium on which the stamp is to be printed is an authorized serial number;
  - if the user is an authorized user and the serial number is an authorized serial number, receiving a print program from said website server over the Internet; and
  - using said print program, printing said machine-readable portion on a pre-processed label by said printer.
2. (Original) The method of claim 1 wherein said print program is downloaded from said website server and stored in said memory.
3. (Original) The method of claim 1 wherein said markup language includes a Standard Generalized Markup Language (SGML).
4. (Original) The method of claim 1 wherein said markup language includes a Hypertext Markup Language (HTML).

5. (Original) The method of claim 1 wherein said markup language includes an eXtensible Markup Language (XML).

6. (Previously presented) The method of claim 1 wherein said print program includes an ActiveX control.

7. (Previously presented) The method of claim 1 wherein said print program includes a dynamic link library(dll) file.

8. (Previously presented) The method of claim 1 wherein said print program does not require a license from the United States Postal Service to execute.

9. (Previously presented) The method of claim 1 wherein said print program does not require a separate account from the United States Postal Service to execute.

10. (Currently Amended) A method for obtaining a postage stamp by a user system, comprising a processor, a memory, and a printer, from a website server over a communications network, said method comprising:

verifying that a user is an authorized user and that a serial number of a medium on which the stamp is to be printed is an authorized serial number;

if the user is an authorized user and the serial number is an authorized serial number, storing a print program downloaded from said website server over the Internet in said memory;

requesting said stamp from said website server over the Internet;

receiving an XML message over the Internet comprising encoded binary data representing a machine-readable portion of an indicium associated with said stamp, said indicium comprising a digital signature; and

using said print program, printing said machine-readable portion on a pre-processed label by said printer.

12. (Original) The method of claim 10 wherein said requesting includes an XML data structure.

13. (Original) The method of claim 12 wherein said XML data structure includes a serial number that identifies said pre-processed label.

14. (Previously presented) The method of claim 10 wherein said print program includes an ActiveX control.

15. (Original) The method of claim 10 wherein said print program is downloaded only once.

16. (Original) The method of claim 10 wherein said print program is downloaded each time a user logs into said website server.

17. (Original) The method of claim 10 wherein said encoded binary data is base 64.

18. (Original) The method of claim 10 wherein said pre-processed label has at least one of the following security features: bar-coding, micro-printing, watermarking, fluorescent strips, serrated edges, taggants, label sheet serial number, or individual label serial number.

19. (Original) The method of claim 10 wherein said XML message further comprises a meter number, a rate class, and an amount of postage.

20. (Original) The method of claim 10 further comprising:  
using said print program, printing a logo on said pre-processed label by said printer; and

using said print program, printing microprint line on said pre-processed label by said printer.

21. (Original) The method of claim 10 further comprising:

using said print program, printing said meter number on said pre-processed label by said printer;

using said print program, printing said rate class on said pre-processed label by said printer; and

using said print program, printing said amount of postage on said pre-processed label by said printer.

22. (Currently Amended) A computer program product stored in a computer readable medium for obtaining a postage stamp by a user system, comprising a processor, a memory, and a printer, from a website server over a communications network, said computer program product comprising:

code for requesting said stamp from said website server over the Internet;

code for receiving an XML message over the Internet, said XML message comprising encoded binary data representing a machine-readable portion of an indicium associated with said stamp, said indicium comprising a digital signature;

code for verifying that a user is an authorized user and that a serial number of a medium on which the stamp is to be printed is an authorized serial number;

code for receiving a print program from said website server over the Internet if the user is an authorized user and the serial number is an authorized serial number; and

code for using said print program for printing said machine-readable portion on a pre-processed label by said printer.

23. (Original) The computer program product of claim 22 wherein said code for requesting comprises an XML data structure.

24. (Original) The computer program product of claim 22 wherein said XML message further comprises a postal rate class.

25. (Currently Amended) A system for obtaining a postage stamp from a central server via a communication network, comprising:

a memory;

a processor coupled to said memory for sending a user request for said postage stamp in a markup language format to said central server over the Internet;

a software module stored in said memory for extracting an indicium from a markup language message received over the Internet in response to said user request, said indicium including a digital signature;

a software module stored in said memory for verifying that a user is an authorized user and that a serial number of a medium on which the stamp is to be printed is an authorized serial number

a software module stored in said memory for extracting a print program from said markup language message received over the Internet in response to said user request if the user is an authorized user and the serial number is an authorized serial number;

a printer for printing said indicium on a pre-processed label, wherein said print program is configured to permit the printing of the pre-processed label on the printer.

26. (Original) The system of claim 25 wherein markup language is XML.

27. (Original) The system of claim 25 wherein markup language is SGML.

28. (Previously presented) The system of claim 25 wherein markup language is HTML.

29. (Original) The system of claim 25 wherein said software module includes an ActiveX control.

30. (Original) The system of claim 25 wherein said software module includes a print.dll.

31. (Previously presented) The system of claim 25 wherein said indicium further comprises a serial number.

32. (Original) The system of claim 25 wherein said pre-processed label has at least one of the following security features: bar-coding, micro-printing, watermarking, fluorescent strips, serrated edges, taggants, label sheet serial number, or individual label serial number.
